

tados en el control de la vegetación superior en los lagos y lagunas donde estos vegetales constituyen un problema. Estos peces no se desarrollan en aguas corrientes o en climas fríos (52). Además de ser peces muy voraces, se reproducen con gran facilidad en los ambientes favorables y ofrecen una carne muy sabrosa, siendo doblemente ventajosa su implantación en los lagos donde la vegetación superior, ya sea sumergida o emergente, constituyen un problema sanitario o de cualquier naturaleza. Pero no son eficientes en el control de totora.
