INGLUVIN is a very appropriate name for this remedy. It is the essential principle of the gizzard, and bears the same relation to poultry that pepsin does to the higher animals. The honour of its discovery and utilisation, in its crude state, remotely dates back to the Chinese gastronomer, as well as (in its refined condition) to the Caucasian chemist. From time immemorial the inhabitants of the Celestial Empire have used the gizzards of chickens and ducks in nearly all made dishes. Their writers have recommended the practice as a sovereign treatment of dyspepsia, weak stomach, and vomiting. A favourite prescription of Chinese physicians for chronic indigestion is to cut up and digest chicken gizzards in hot water until they are reduced to a pulp, and then add some spices. A tablespoonful or two of the resulting paste is taken at each meal until the patient has entirely recovered. From China the practice passed to other parts of Asia, and was adopted here and there among the Mediterranean people. Strange to say, it was never learned by the great nations of Europe until the latter part of the present century. On the other hand, the organic chemists of Europe discovered, about 1850, a powerful nitrogenous radical in the gizzard. Experiments thereafter showed it to possess many of the qualities of pepsin. These experiments led to its isolation. Numberless later experiments have proved it to be a very valuable addition to therapeutics. Where pepsin refuses to act, and where in severe cases it has even been rejected by the stomach, INGLUVIN has effected relief rapidly and with the greatest ease.

"Forest Gate, London, Oct. 18th, 1897.

"I have for over thirty years used Warner's Ingluvin in the sickness of pregnancy and for the nausea and inability to digest food often met with in womb troubles, as well as for vomiting after gynaecological operations and chloroform, and have been very pleased with the relief which has ensued.
