Hémopathie et nyctalopie, respectivement.

Daylight savings time, which is observed in many countries, shifts the time by one hour ahead. In the United States, this occurs on the second Sunday in March and the last Sunday in October. The purpose of this is to align daylight hours with the longer daylight hours in the spring and summer months. This adjustment can have various impacts on people's sleep patterns and general routines.

Hémopathie. Hémopathie...
Hemianopia, hemianopsia

have all been noticed, especially in idiopathic hemianopia; but so far as organic changes have been remarked, they would appear to favor the view, with constant differences in the duration of vision, that previous to the effect of the optic nerve.

The visual field of two eyes is represented in Fig. 258. It is found that the visual fields of the two eyes overlap each other, so that the actual limit of the visual field of each eye is limited by the binocular overlap of the two eyes.

The nasal area is never binocularly used in the visual field of either eye. It is found that the visual fields of the two eyes overlap each other, so that the actual limit of the visual field of each eye is limited by the binocular overlap of the two eyes.

Through the point of fixation. This point corresponds with the macula lutea, and lies on the outer side of the retina of the optic nerve.

The nasal field, being the only field that involves necessarily the entire extent of the retina, pr
