Lymph, Leukocytes

**REFERENCE HANDBOOK OF THE MEDICAL SCIENCES.**

Lymph, Leukocytes

Lymphatic circulation is the lymphatic system, which is composed of lymph vessels, the lymph nodes, and lymph nodes. The lymphatic system is responsible for the transport of lymph, a fluid that contains lymphocytes and other immune cells, throughout the body. The lymphatic system helps to maintain the body's defense mechanisms against infections.

Lymphocytes are a type of white blood cell that play a crucial role in the immune system. They are produced in the bone marrow and mature in the lymph nodes. Lymphocytes can be divided into two main types: B lymphocytes and T lymphocytes. B lymphocytes produce antibodies, while T lymphocytes help to coordinate the immune response.

The immune system is responsible for protecting the body from infection by foreign substances, such as viruses and bacteria. The lymphatic system is a major component of the immune system, as it contains lymph nodes and lymphocytes that help to fight off infections.

Lymphatic circulation is important for the transport of lymph, a fluid that contains lymphocytes and other immune cells, throughout the body. The lymphatic system helps to maintain the body's defense mechanisms against infections.
Lymph. Lymphangitis.
